**ROTO-DISC® Co. INTRODUCES AN INFLATABLE SEAL VALVE FOR  
HIGH-PRESSURE AND PNEUMATIC CONVEYING APPLICATIONS**

Cincinnati, OH, For Immediate Release – The Roto-Disc® Company now offers the Roto-Flate™ inflatable-seal valve. The Roto-Flate™ is ideal for processing environments that require bubble-tight sealing up to 150 PSI and full vacuum. Common applications are as a reactor fill valve or as a shut-off or isolation valve in dense-phase pneumatic conveying systems. The valve is well suited for highly abrasive, corrosive and/or toxic product and temperatures up to 425°F. The Roto-Flate™ requires only a quarter-turn from full closed to full open. Unlike an inflatable seal butterfly valve, the seal on the Roto-Flate™ is protected from the product flow, so seals last longer.

Inlet port sizes 3” through 12” and in a variety of materials of construction to meet the application requirements. Also available in double-dump assemblies for air-locking product into sealed processes. The Roto-Flate’s™ heavy-duty construction offers years of 24/7 dependability, even for campaigns with frequent cycles. The design will not jam, pinch or obstruct the flow of product. **Roto-Disc® Co.**, 4612 Kellogg Ave., Cincinnati, OH 45226 (513) 871-2600, [www.rotodisc.com](http://www.rotodisc.com), [info@rotodisc.com](mailto:info@rotodisc.com)
